Professional Summary

Computer Science graduate (B.S.) with hands-on autonomous vehicle road-testing experience at NVIDIA and Tesla, pairing a systems-level Linux/C background with telemetry and log diagnostics and clear, direct feedback to engineering teams.

Technical Skills

Languages & Systems: C, C++, Python, Bash/Shell Scripting, Linux (Debian/Ubuntu/Unix internals), POSIX, pthreads
Data & Distributed Systems: High-Throughput Telemetry Capture, Multimodal Data Integrity, Schema Design, MySQL/MariaDB
Infrastructure & Networking: Docker, Nginx, Git/GitHub, TCP/IP, System Hardening (UFW, Fail2Ban), Log Diagnostics (grep, tail, cat)

Technical Experience

NVIDIA (via Insight Global) California
AV Test Expert – Autonomous Vehicle Road Testing *Jul 2026 – Present*

- Operate autonomous test vehicles on public roads while monitoring system performance, serving as both driver and test operator.
- Utilize Linux-based command-line tools daily to diagnose and troubleshoot issues on autonomous vehicle test systems.
- Monitor vehicle behavior during test drives and annotate incidents when the vehicle performs unexpected or out-of-spec actions.
- Review and execute structured test plans, and prepare and inspect test vehicles prior to deployment to ensure on-road readiness.
- Communicate findings to engineering teams, providing direct feedback on vehicle build performance and behavior observed during testing.

Tesla San Francisco, CA
AI Safety Operator – Full Self-Driving (FSD) Program *Oct 2025 – Jul 2026*

- Executed data-ingestion and validation routines for a distributed edge-compute platform, contributing to over 1,000 hours of safety-critical deployments and real-world edge-case capture.
- Analyzed telemetry, camera data, and low-level Linux logs to isolate software anomalies and hardware-to-software integration faults, documenting each in structured logs for developers and autonomous systems engineers.
- Performed system calibrations and ensured data integrity during high-volume post-route transfers.
- Selected to lead onboarding for 4 incoming team members on data collection, system monitoring, and operational safety criteria.

Technical Projects

Raspberry Pi Automated Infrastructure | *Bash, Docker & Compose, Linux, Networking* Sep 2024 – Present

- Maintain a self-hosted containerized stack with automated Bash backups, cron jobs, and HTTPS certificate rotation, hardened with UFW firewalls and Fail2Ban intrusion prevention.

Unix Shell & OS Systems Projects | *C, POSIX Threads, Linux Kernel Modules* Aug 2022 – May 2025

- Built a Unix-style command-line shell from scratch in C (process creation, pipelines, I/O redirection) and a multithreaded file processor using pthreads and mutexes for safe concurrency.
- Authored a custom Linux device driver interfacing directly with kernel space, building low-level OS diagnostics and hardware-software interaction skills.

Education

San Francisco State University San Francisco, CA
Bachelor of Science in Computer Science *Aug 2022 – June 2025*

- **Senior Capstone Database Team Lead:** Led a cohort of 4 on relational database schema design, query optimization, and Git version control workflows for a distributed web application.
